```

To inspect the end of the firmware image, the final 4 KB of the file were examined in a hex editor.

The starting offset of this region was calculated by subtracting 0x1000 (4096 bytes) from the final offset of the file:

0x311EF8F0 - 0x1000 = 0x311EE8F0

At the beginning of this region there is still some binary data. Shortly after that, several readable strings appear that are related to SELinux labels, for example:

selinux#
system_u:object_r:etc_runtime_t:s0
system_u:object_r:root_t:s0

These strings suggest that the firmware likely contains a Linux-based filesystem where SELinux security contexts are stored as part of the system metadata.

After this small section with readable strings, the rest of the footer area is filled almost entirely with zero bytes (00). This likely represents padding used to align the firmware image to a specific storage boundary. Such alignment is common in firmware images because flash memory and bootloaders often operate with fixed block sizes.
